¹ Service Area (Catchment Area) a: Geo-graphic area defined and served by a hospital. Delineated on the basis of such factors as population distribution and natural geographic boundaries.

² Relevance Index Service Area a: The sum of the product of the proportion or density of use of each hospital by each small population.

ACKNOWLEDGEMENTS

Generous appreciation is extended to the Staff of the Bureau of Health Planning and Resource Development for their assistance in preparing this report--especially Doris Downs, Sherryl English and Carolyn Turcotte.

The source of this information is the Patient Origin Study of Montana Hospitals, 1979, which contains information on discharges for the period July 1, 1978 to June 30, 1979.

The Study contains two indexes; the Relevance Index and the Commitment Index.

The Hospital catchment areas contained in this report were derived from the Commitment Index. For purposes of this study, hospital catchment areas represent the percentage of population from a geographic area (city, in this study) which used the hospital. No attempt has been made to delineate particular boundaries, i.e., specific catchment areas.

EXPLANATORY NOTE:

As a general rule, cities/towns which constituted less than 1% of the discharges for the hospital were excluded due to the small numbers.

Some exceptions, however, were made and these are footnoted. That is, the entire catchment area of some hospitals is given due to the extremely sparse number of discharges.

Also, some cities/towns which contributed less than 1% of the hospital's discharges are shown due to their significant numbers. Again, all the exceptions have been noted for each hospital.

The Relevance Index, which is included in the first part of the Report, may be used to calculate the service area population for each hospital. Specific service area calculations will overcome the shortcomings of using counties as service areas. This has been done for each individual hospital in Montana.

The principle behind the calculations is as follows:

Service Area Population = $\sum E_i P_i R_i$

P_i = population of the i th tract (county, etc.)

R_i = percentage of total admissions from the tract (the row percentage appearing in the Relevance Index)

For example:

Hospital ABC

	Population of the Area* (P_i)	Relevance Index Score% (R_i)	Total
County X	5,000	45.88	2,294
County Y	4,000	6.69	268
County Z	2,500	.39	10

Population served from the region $\sum E_i P_i R_i = 2,572$

* The population figures for counties is available in the Montana Health Data Book which was sent to all hospitals and is available through the Health Planning and Resource Development Bureau.

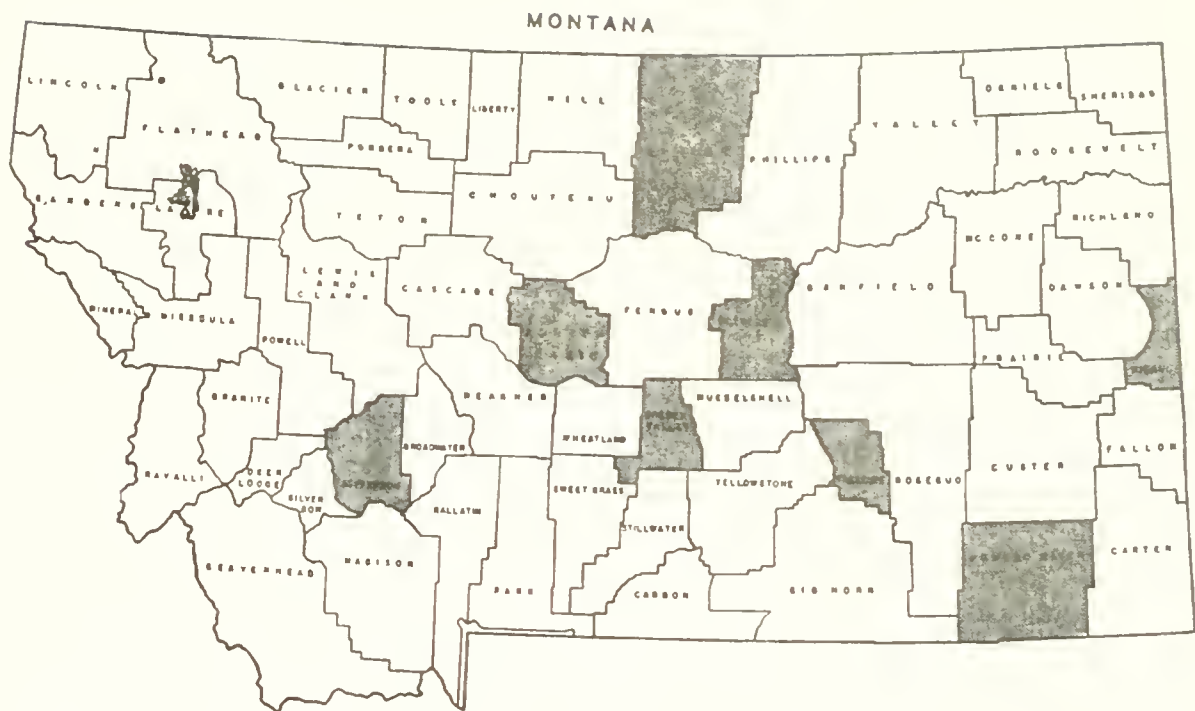

The Relevance Index uses the geographic region (county, city, etc.) as the base and shows the tendency of the geographic tract to use the study hospital(s). For this reason, all the hospitals of a region or state have to participate in order to make the data comprehensive; this criterion has been met.

In addition, the total service area population of a hospital can be used to estimate the total bed complement of a hospital. However, a precaution must be interjected since hospital bed need is not based merely upon population but also includes the type of bed utilization and services delivered by a hospital. More specific information is needed to determine if a hospital needs more beds or to make a determination regarding the type of bed needed. Hospitals, themselves, have this specific information at the present.

As use of the Study will illustrate, hospitals do not capture an entire county population--not even counties in which the hospitals are located. This clearly indicates the usefulness of the Patient Origin Report and the need for calculating specific service area populations via patient origin.

Please note totals from this Report may differ from the totals in the Patient Origin Study of Montana Hospitals in 1979, due to non-inclusion of unspecified zip codes. Also, this report has been corrected according to the errata noted in this report (see Appendix).

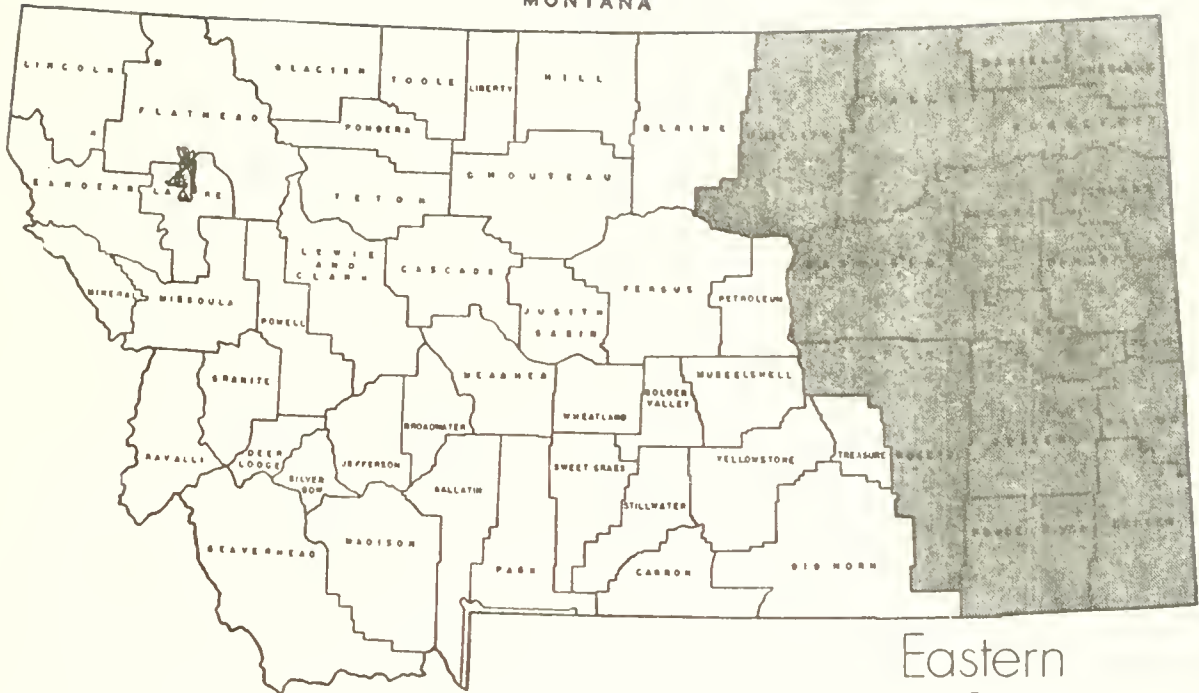

An additional caution is needed since the service area population of some hospitals (those footnoted in the Patient Origin Report) will be somewhat exaggerated due to the inclusion of newborns of these facilities. Newborns were not subtracted because origin information was not available for them.

Counties without hospitals

APPENDIX

ERRATA

Because the town of Rollins (zip 59931) was inadvertantly placed in Flathead county as well as in Lake county, and the town of Saltese (zip 59867) was inadvertantly placed in Sanders county as well as in Mineral county, the attached corrections to the tables should be made.

Since the error is $42 / 128,704 = 0.0003263 = 0.03\%$, round off error will allow some of the otherwise erroneous percentages to be correct as printed.

NOTE: The overall total (128,704), the row (county) totals, the column (facility) totals, and the regional subtotals are all computed independently. Similarly, the percentages are calculated against the appropriate base figure without regard to other figures in the same row or column. Thus, a cell entry causing an error in the county total will not cause an error in the regional subtotal which includes that county. Likewise, since the computer program does not add the figures shown in the columns to obtain the column total as printed, an error in an individual cell in the column will not cause an error in the facility (column) total.

For this reason, only the entries itemized on the attached pages need be changed.
